¿Cuales son las características de las viviendas rurales en colombia?

Identificar las características que tienen las viviendas rurales en la actualidad evidenciando las estrategias bioclimática y sostenibles presentes en cada una de ellas.

-Clasificar las características físicas de la vivienda
-Identificar virtudes y falencias de estas.

- Identificación de materiales y análisis práctico de los mismos.
- recolección de datos cuantitativos y cualitativos de falencias y virtudes en zonas rurales.

- Análisis de materiales en el Domo Bioclimático
- Investigación de resistencias térmicas en los materiales
- Entrevistas y recolección de datos en zonas rurales con ayuda de Argis

¿Que metodos se pueden utilizar para el desarrollo de la viviendas rurales sostenibles?

Diseñar a partir de la implementación de la metodología BIM y la incorporación de principios sostenibles asociados al ahorro del agua, materialidad y autogeneración aplicando parámetros sostenibles a modelos de viviendas rurales dependiendo de las condiciones climáticas y partiendo de las necesidades básicas de los pobladores.

- Identificar las necesidades de las viviendas según el clima.
- Identificar parámetros sostenibles básicos
- Simulaciones energéticas

-Programas BIM
-Mapeo para el desarrollo del proyecto
-Diagramas de Olyay y Givoni para el diseño de estrategias sostenibles
- vinculación de modelos digitales BIM y sus bases de datos.

- realización de simulaciones energéticas por medio de POWERBIM
- Mapeo y construcción cartográfica con Sistemas de Información Geográfica (SIG)

¿Que parámetros deben tener las viviendas rurales sostenibles?

Evaluar mediante simulaciones el comportamiento energético ambiental de las viviendas diseñadas en diversos ambientes para identificar el cumplimiento de los parámetros de sostenibilidad.

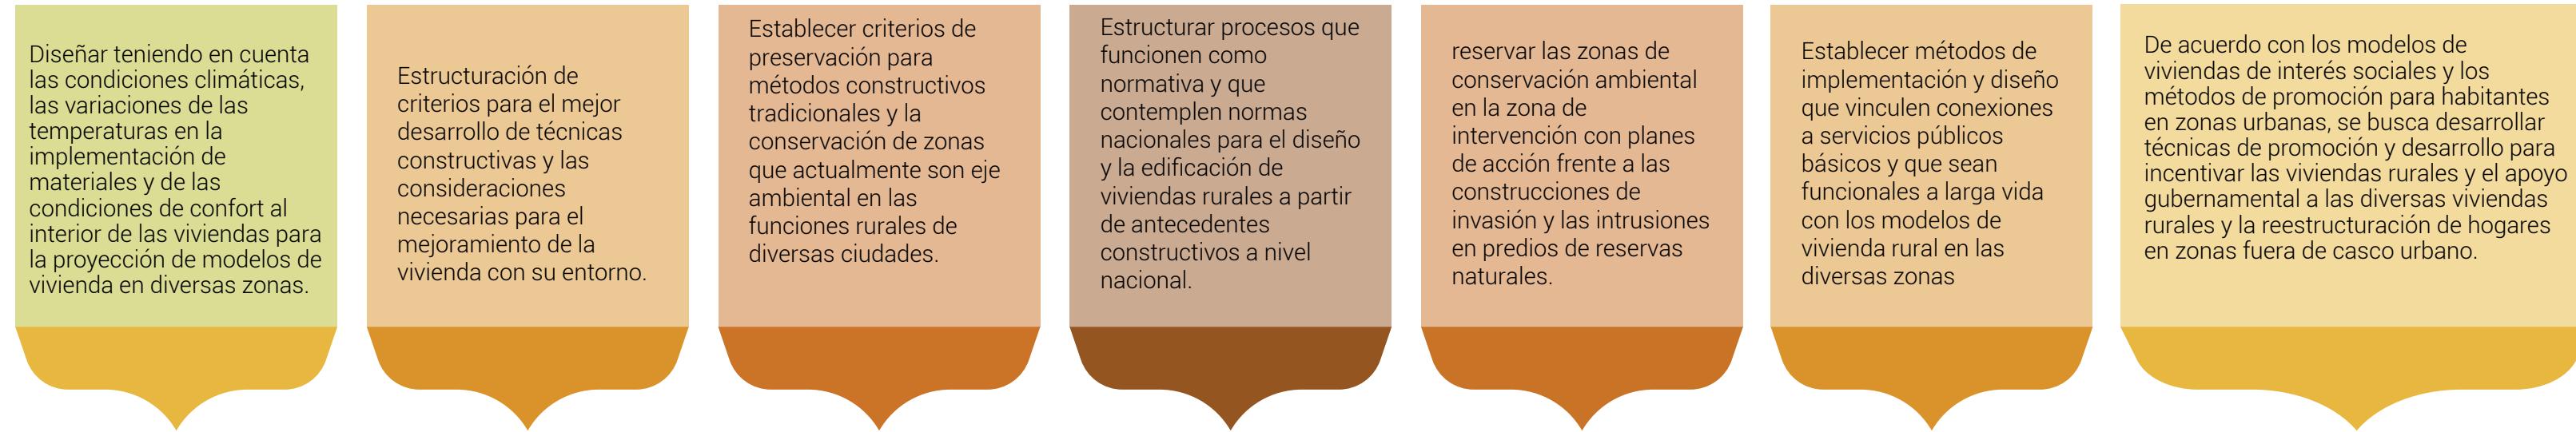

-Simular el comportamiento de las viviendas.

- Simulación de vivienda a través de metodología BIM.
- Ensayos prácticos para la simulación de factores sostenibles.

- Implementación de Navisworks
- creación y análisis en Revit

¿Como identificar las falencias de las viviendas diseñadas?

AMBIENTAL ECONOMICO SOCIOCULTURAL

Diseñar la vivienda de acuerdo con las condiciones ambientales de la zona para mejorar el confort térmico al interior de ella.

Identificar las variables térmicas y el uso de materiales correspondientes a la zona climática.

Conocer la cultura y determinar a partir de diseños participativos la necesidad de la comunidad.

Establecer dinamias de integración social para las personas desmovilizadas de la zona y la reestructuración de viviendas en sectores de violencia extrema en el territorio.

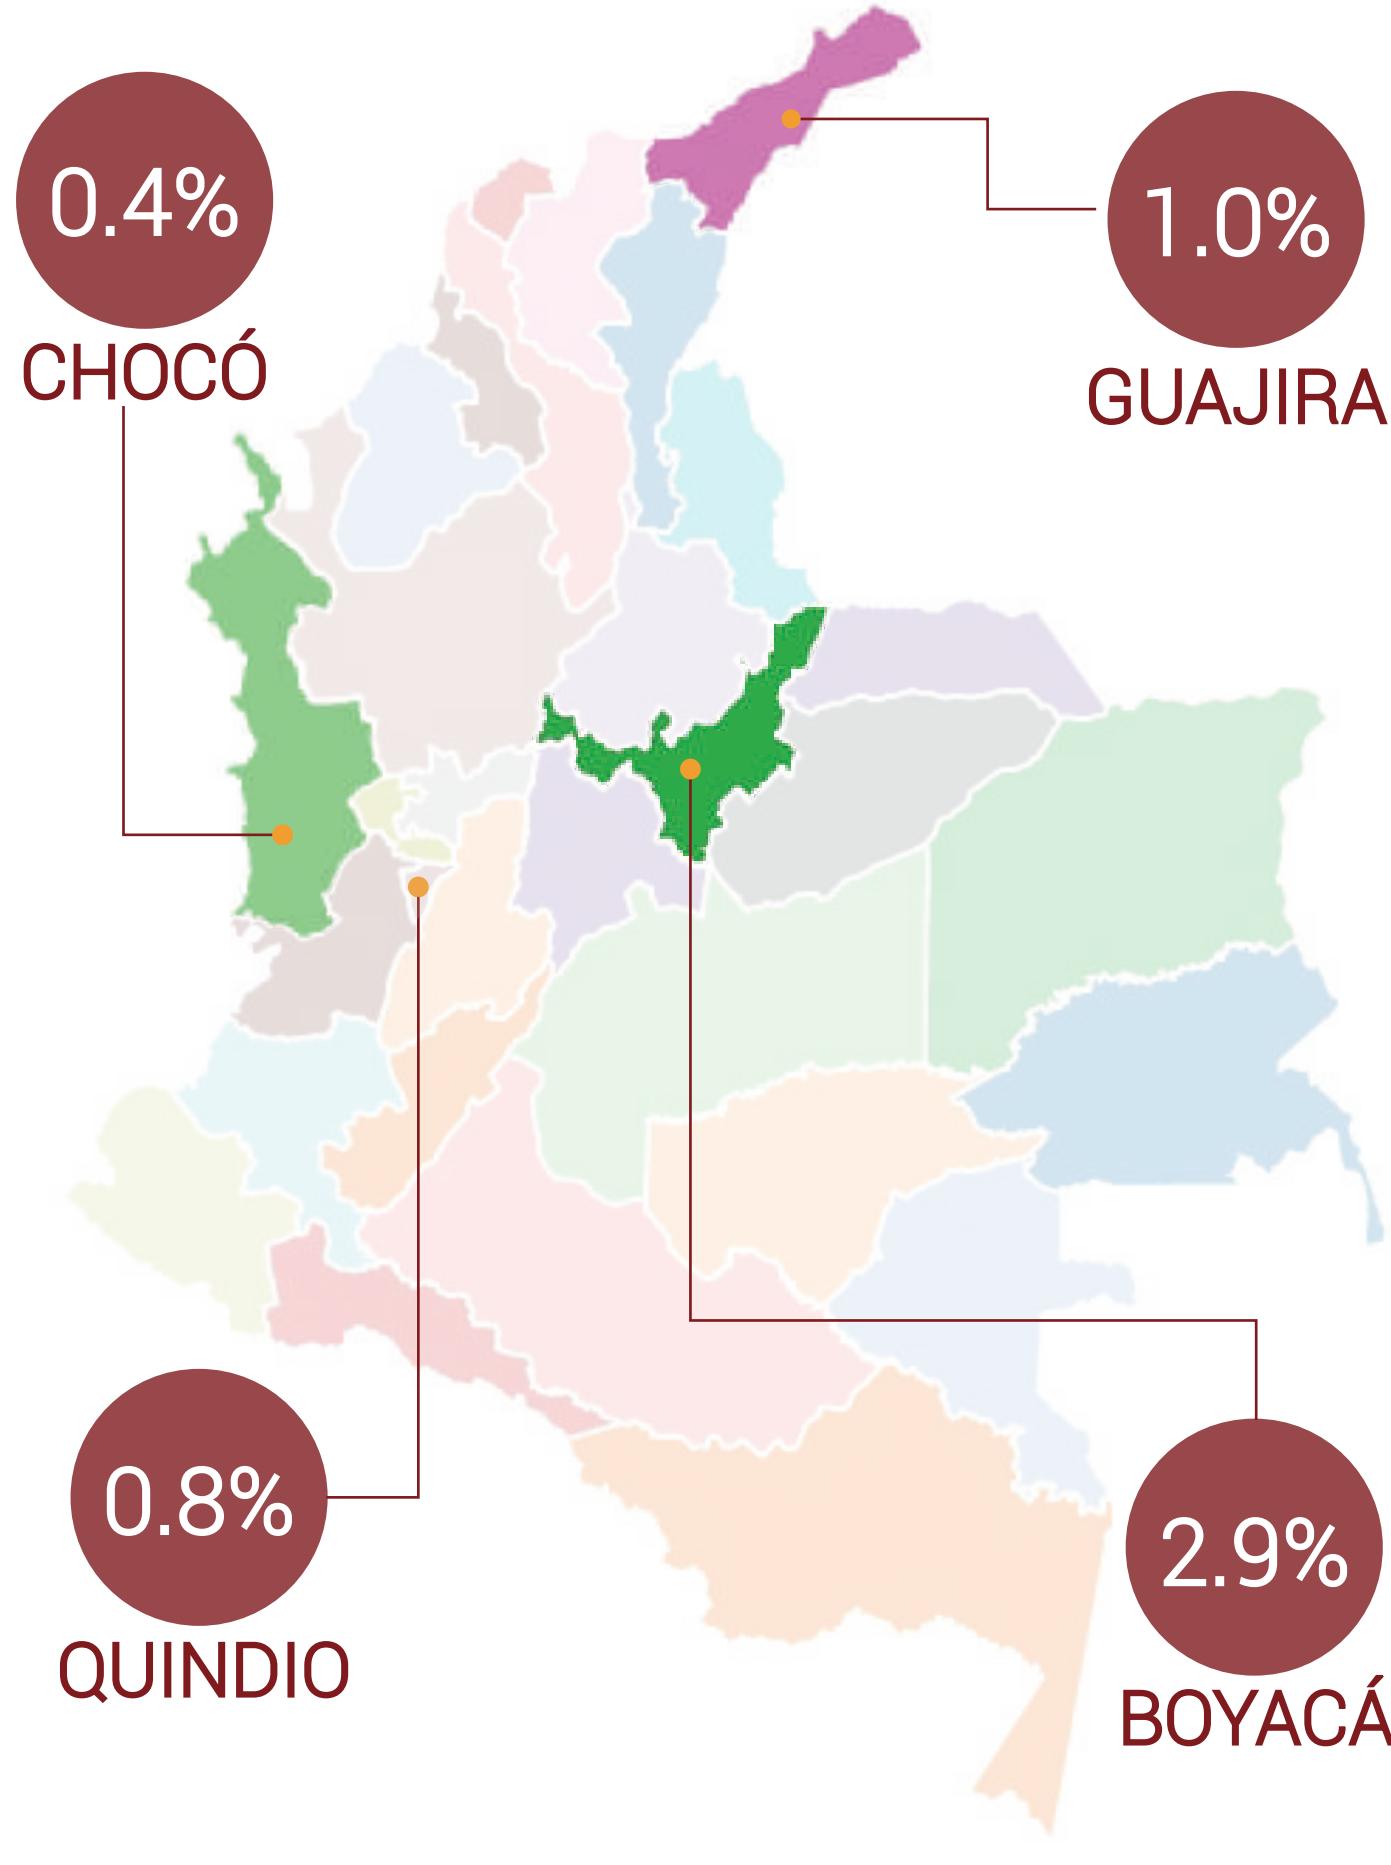

Incentivar los procesos constructivos que fomenten nuevas tecnologías y desarrollos eficientes para el medio ambiente y para la comunidad.

Establecer criterios básicos de sostenibilidad y la manera de implementación en las viviendas rurales.

Exploración y conocimiento de los métodos de construcción e implantación de las viviendas en el sector como método para identificar deficiencias en los mismos.

Contemplar planes de acción para el desarrollo, construcción y vida útil de las diversas viviendas rurales a partir de los criterios de construcción y las catástrofes naturales que se han presentado anteriormente en la zona con el fin de prever y prevenir dichos actos a futuro.
